PROJECT NAME	PocketSmart AI: Your Smart Budget & Recommendation Assistant

Phase 01: Brainstorming

1. Introduction

Managing budgets across different life needs, such as home decor, event planning or jewelry shopping, can be overwhelming because of the wide variety of products, platforms and price ranges. Users often compare many websites, lose track of what they have spent and still end up over budget.

PocketSmart AI is a GenAI-powered, cross-platform recommendation system that delivers personalized, budget-based suggestions for products and services. The user enters a total budget and a few preferences. The system uses Google Gemini 2.5 to divide the budget sensibly and recommends items with estimated prices and direct search links to platforms such as Amazon, Flipkart, IKEA, Swiggy, Zomato and OYO.

2. Problem Statement

How can an everyday shopper or event host turn a single total budget into a complete, realistic and platform-aware plan for home interiors, parties and jewelry, without hours of manual research and without exceeding the budget?

2.1 Objectives

- Convert a total budget into a category-wise allocation automatically.
- Recommend products and services from popular Indian platforms with prices in INR.
- Accept text and an optional outfit image so jewelry suggestions match style and colour.
- Keep a personal history of every plan so users can review and reuse it.
- Provide a simple, secure and responsive web experience with user login.

2.2 Scope

Included in this version	Not included in this version
Home, Party and Jewelry budget planners	Online payment or in-app purchase
Gemini-generated budget breakdown and search terms	Live price tracking or scraping
Shopping links to several platforms	Vendor onboarding or partnerships
User registration, login and history	Native mobile applications

3. Empathy Map and User Pain Points

Three typical users were considered to understand what they think, feel, say and do while planning a purchase or an event.

	Priya (Jewelry shopper)	Rahul (Party host)	Sneha (New home owner)
Thinks	Will this match my outfit? Am I overpaying?	Will my budget cover food, decor and fun?	Which fan or light is worth the price?
Feels	Anxious about choosing wrongly	Stressed by too many vendors	Overwhelmed by choices
Says	Show me something within my budget	Give me a split I can trust	I want a nice home without overspending
Does	Opens many tabs and compares	Calls vendors and asks friends	Browses IKEA and Amazon for hours
Pain	No outfit-aware suggestions	No single view of total event cost	No room-wise allocation
Gain	Elegant match within budget	Clear plan with a buffer	Balanced style, function and price

3.1 Key Pain Points

- Information overload across many shopping and service platforms.
- No single tool links one total budget to many categories.
- Generic search results ignore occasion, style and outfit colour.
- Earlier plans are forgotten or lost.

4. Ideation and Prioritization

Ideas were collected in an open brainstorming session and scored from 1 to 5 for user value, technical feasibility and effort required.

No.	Idea	Value	Feasibility	Effort	Decision
1	Home interior budget planner	5	5	3	Build
2	Party planner: catering, decoration and entertainment split	5	4	3	Build
3	Jewelry planner with outfit image analysis	5	4	4	Build
4	Recommendation history and re-use	4	5	2	Build
5	User login with secure token and sessions	4	5	2	Build
6	Fashion planner (clothes, shoes)	4	3	4	Future

No.	Idea	Value	Feasibility	Effort	Decision
7	Travel budget planner	4	3	4	Future
8	Live price comparison	3	2	5	Future
9	Voice input for budgets	2	3	4	Later
10	Shared group budgets	3	3	4	Future

Ideas 1 to 5 form the minimum viable product because they give the highest value, share one Gemini-based pipeline and can be completed within the internship schedule. The remaining ideas are kept for future scope.

5. Proposed Solution

PocketSmart AI is a FastAPI web application with a Jinja2 frontend. Forms collect the user's budget and preferences. The backend prepares a structured request for Gemini 2.5, receives the suggested budget breakdown and items, and adds shopping links suited to each category.

Planner	User input	AI output	Platforms linked
Home Interior	Budget, rooms, number of lights, fans, furniture and dining tables	Category allocation, items, prices, remaining budget	Amazon, Flipkart, IKEA, Myntra, Ajio
Party	Budget, guests, party type, venue, needs	Venue, catering, decoration, entertainment, contingency	Swiggy, Zomato, BookMyShow, OYO, MakeMyTrip, Amazon
Jewelry	Budget, occasion, style, optional outfit image	Outfit analysis, jewelry items, prices, styling tips	Amazon, Flipkart, Bluestone, Tanishq, CaratLane

5.1 Value Proposition

- One budget produces a complete plan across three areas of life.
- Multimodal input: the system understands an outfit photo as well as text.
- Indian-market focus with INR prices and Indian brands.
- Personal history so that no plan is lost.

5.2 SWOT Analysis

Strengths	Weaknesses	Opportunities	Threats
Fast GenAI reasoning, modular design, multimodal input	Prices are estimates and depend on model quality	More planners, regional languages, affiliate model	API quota limits, changing platform URLs

5.3 Success Criteria

- Plans stay within the entered budget in most test runs.
- A recommendation is returned within about 15 seconds.
- Every recommended item has working search links.
- Users can log in, generate a plan and find it later in history.

5.4 Conclusion

The brainstorming phase identified budget overload as a real everyday problem and defined a focused solution: an AI assistant that converts one budget into a complete, platform-aware plan for home, party and jewelry needs. The next phase analyses the detailed requirements of this solution.
