

Phase 1 - Brainstorming and Idea Prioritization

PocketSmart AI: Your Smart Budget & Recommendation Assistant

Date: 29 September 2026

1. Introduction

PocketSmart AI was conceived to address the difficulty of managing budgets across everyday lifestyle needs such as home décor, event planning, and jewelry shopping. The project combines budgeting, contextual planning, and Generative AI recommendations in one web application.

2. Problem Identification

Users may face a wide range of products, services, platforms, and price ranges when working with a fixed budget. Searching and comparing options manually can take time and can make it difficult to distribute the available budget effectively.

3. Initial Project Direction

The proposed solution is a cross-platform, budget-aware recommendation assistant that accepts a user's budget, preferences, and planning context and produces curated suggestions.

Brainstorming - Use Cases and User Needs

4. Main Ideas / Use Cases

- Home Interior Planning – budget, room types, quantities, furniture, lighting and décor requirements.
- Party Budget Planning – total budget, guest count, event type, venue and related event requirements.
- Jewelry Recommendations – budget, occasion, style preference and optional outfit image.

5. User Needs

- Simple budget input and clear forms.
- Recommendations organized by category.
- Suggestions based on budget, preferences and context.
- Optional image support for jewelry matching.
- Easy review of previous recommendation queries.

6. Proposed Technology Direction

The project source specifies FastAPI for backend routing and session control, Gemini 1.5 Flash Pro for multimodal AI processing, HTML/CSS + JavaScript for the frontend, and platform/API or simulated sourcing for product and service recommendations.

Brainstorming - Evaluation and Prioritization

7. Evaluation Criteria

- Feasibility – can the idea be implemented using available web, backend and AI technologies?
- Usefulness – does it solve a practical budgeting/planning problem?
- AI Integration – does Generative AI add useful recommendation intelligence?
- User Experience – can users enter information and understand results easily?
- Extensibility – can additional planning categories be added later?

8. Feature Prioritization

Feature	Priority	Reason
Budget-based recommendations	High	Core purpose
Home Planner	High	Home planning workflow
Party Planner	High	Event budget workflow
Jewelry Planner	High	Occasion/style and image context
Authentication	High	Personalized access
Recommendation History	High	Review and reuse previous plans

Brainstorming - Selected Idea and Vision

9. Selected Project

PocketSmart AI: Your Smart Budget & Recommendation Assistant is selected as a practical Generative AI application for budget-aware planning across Home Interior, Party, and Jewelry categories.

10. Project Vision

The vision is to transform ordinary budget planning into an intelligent and user-friendly experience. Instead of searching separately across many categories, the user supplies the planning context and receives curated suggestions.

11. Expected Benefits

- Faster planning across multiple categories.
- Personalized recommendations based on budget and preferences.
- Context-aware suggestions for events, interiors and occasions.
- Optional multimodal analysis for jewelry planning.
- Centralized recommendation history.

12. Conclusion

The brainstorming phase establishes the real-world problem, the three major planning domains, and the overall direction of PocketSmart AI.
